Crowns & Bridges

Crowns and bridges are used to restore and enhance teeth that are damaged, or to take the place of missing teeth. A crown, also referred to as a cap, is used to entirely cover a damaged tooth. A crown not only strengthens a tooth, but it can dramatically improve a tooth's appearance, shape and alignment.

Crowns may be used to:

- Replace a large filling when there is little tooth structure remaining
- Protect a weak tooth from fracturing
- Restore a fractured tooth
- Attach a bridge
- Cover a dental implant
- Cover a discolored or poorly shaped tooth
- Cover a tooth that has had root canal treatment

A bridge is an ideal method to fill the space created by missing teeth. A bridge is one or more artificial teeth that are cemented into place using the teeth on either side for support, hence the name. This is an option for filling the space created by a missing tooth. A bridge replaces the missing tooth, both functionally and cosmetically. Bridge work is as much an art as it is an exact science. The materials

used may be gold alloys, porcelain bonded to metal alloy, or all ceramic material made to match your natural tooth color.
