INTRAORAL CAMERA

We use small cameras about the size of a pen, called intraoral cameras, to help clearly see the condition of your teeth and gums.

With this advanced technology we can zoom in on small diseased areas, cracks, chips and worn metal fillings with extreme precision. The full-color images taken with the intraoral camera are sent to a computer screen so we can clearly see and diagnose dental problems much earlier. Images are displayed on our screens, patients will also be able to see areas being worked on and are able to gain a better understanding of dental procedures being performed.
