LASER DENTISTRY

Laser dentistry is the latest advancement in dental technology, treating a wide range of dental and cosmetic problems from cavities to gum disease to teeth whitening. The lasers we use in laser dentistry at our practice are an alternative to the common hand-held scalpel, drills, or other tools. These lasers direct an invisible energy beam onto problem areas and allow us to efficiently treat decayed teeth, enamel, and gums. The benefit of laser dentistry is that they minimize the pain most often associated with dental procedures, meaning more comfort to our patients. Clinical studies show that approximately 96% of all patients require no anesthesia when lasers are being used during dental treatments. Dental lasers have been approved by the Food and Drug Administration and are safe for both adults and children.

Soft Tissue Laser

Soft tissue lasers are used to safely remove soft tissue, such as excess gum tissue. The soft tissue laser can also be employed to destroy bacteria in gum pockets, preventing infection and allowing the tissue to return to a healthy state. The soft tissue laser enabled the dentist to treat our patients with extreme accuracy and eliminates the need for most stitches.
